Getting Started

Introductory guide to begin your journey with SAP LeanIX.

The getting started section helps new users understand SAP LeanIX's enterprise architecture products. It covers key concepts, user interface, and essential features, giving you a foundational understanding of SAP LeanIX and its role in enterprise architecture management.

Introduction to SAP LeanIX

SAP LeanIX is a SaaS application that allows you to manage and optimize enterprise architecture. Enterprise architecture management is the practice of aligning IT infrastructure and systems with business strategy and goals. It involves documenting the organization's IT landscape, planning, designing, and overseeing the implementation of architectural changes to meet changing business needs.

SAP LeanIX provides a 360° overview of all your applications, business capabilities, and IT components so you can gain control of your expanding IT landscape and create roadmaps for major transformation initiatives. Through collaborative and democratized data collection, out-of-the-box integrations, and fast insights through reports and diagrams, SAP LeanIX enables you to manage enterprise architecture effectively.

With SAP LeanIX, you can:

- Effectively align IT strategies with business goals
- Map all applications to the business capabilities they support and the underlying dependencies
- Design the ideal IT architecture you aim to create
- Identify cost-saving opportunities and optimize IT investments
- Improve integration and interoperability among different systems and applications
- Mitigate security and compliance risks from technical debt and obsolescence
- Make better, faster business decisions and enhance operational efficiency

The screenshot displays the SAP LeanIX Survey interface. On the left, there is a 'Fact Sheet' section with a 'Fact Sheet element' input field and a list of 'Basic' and 'Advanced' field types including Text input, Number input, Date input, Textarea, Radio, Checkboxes, and Question group. On the right, a modal window titled 'Please define the TIME Classification for your Application' is open, showing a 'Fact Sheet Type' dropdown set to 'Application' and a 'TIME Classification' dropdown. The interface is clean and modern, with a blue header bar and a white background.

Bring stakeholders together and collect data with surveys

[Open this video in a new window](#)

SAP LeanIX Products

SAP LeanIX comprises three products supporting different enterprise architecture domains and use cases.

- **SAP LeanIX Application Portfolio Management:** The base product for documenting and managing your application landscape. It provides insights into application lifecycles, dependencies, technical and functional fit, and business impact. Primarily, it drives the use cases of [Application Portfolio Assessment](#) and [Application Rationalization](#) by helping you identify redundancies and optimize technology investments. This product also includes [SAP AI Agent Hub](#) capabilities.
- **SAP LeanIX Architecture and Road Map Planning:** An additional product that compliments SAP LeanIX Application Portfolio Management. It offers advanced features to plan target architecture, visualize the impacts of the planned transformations, and implement and monitor transformation initiatives. It drives the use cases of [Application Modernization](#) and [SAP ERP Transformation with Integrated Toolchain](#). Learn more in [SAP LeanIX Architecture and Road Map Planning](#).
- **SAP LeanIX Technology Risk and Compliance:** This product extends the capabilities of SAP LeanIX Application Portfolio Management. It facilitates the discovery of the infrastructure layer in your application landscape and enables you to manage obsolescence risks and technology standards. This ensures operational stability and relevance of your technology stack. It drives the use case of [obsolescence risk management](#) and technology standards management. Learn more in [SAP LeanIX Technology Risk and Compliance](#).

Key Concepts and Features

Fact Sheets and Meta Model

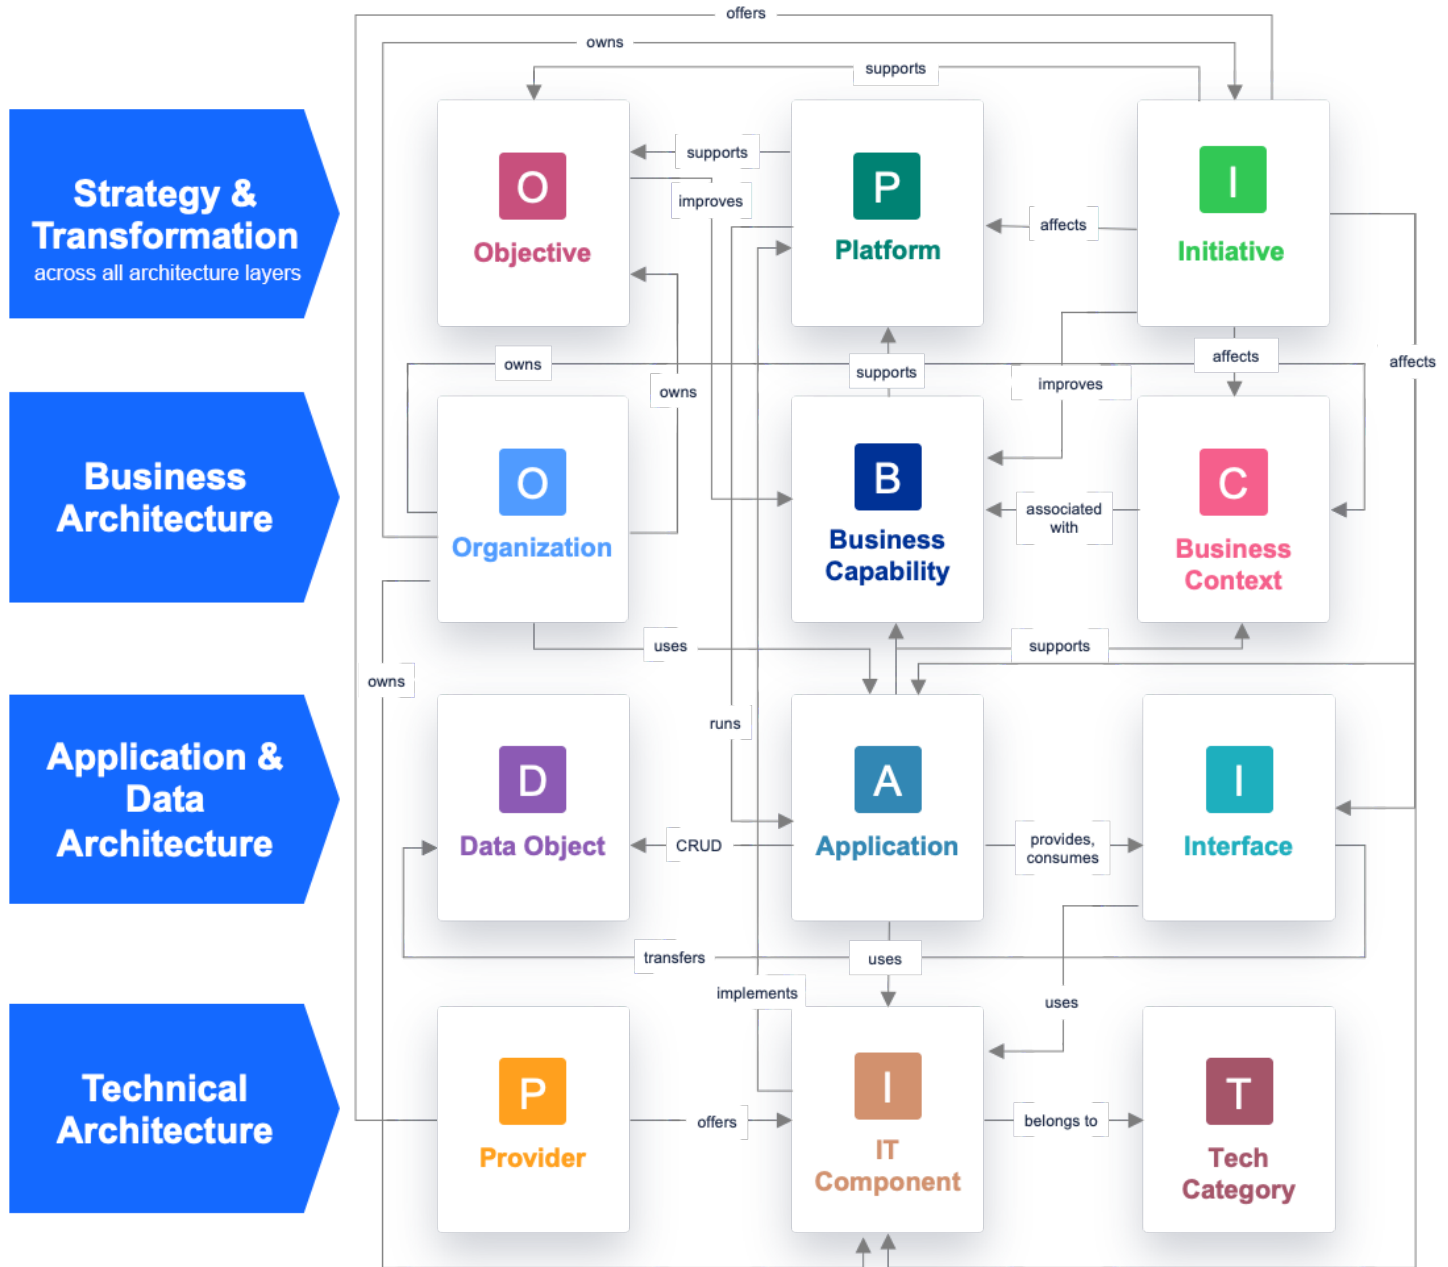

SAP LeanIX documents the organization's IT landscape and architectural elements using so-called fact sheets. Each architectural object, such as applications, business capabilities, IT components, etc., has its own fact sheet to store relevant information.

There are 12 predefined fact sheet types, each serving as a template with specific attributes and fields. For instance, to capture information about an application, you would use the application fact sheet type. It includes attributes such as lifecycle, technical fit, functional fit, etc. Subsequently, individual fact sheets are created for each application you wish to document.

Fact sheets form the foundation of the meta model. Meta model is like a blueprint that defines the relationships between different architectural elements and how the information in fact sheets is interconnected. For example, business capabilities rely on applications, which, in turn, use IT Components, while organizations use applications and so forth.

The meta model can also be customized to adjust the structure and relationships of architectural elements. However, customizing the meta model should be done thoughtfully, as the out-of-the-box meta model is already well-designed for its intended purpose. To learn more about the meta model and modeling fact sheets, see [Meta Model](#).

The high-level representation of the out-of-the-box meta model below shows the associated relationships:

SAP LeanIX Meta Model

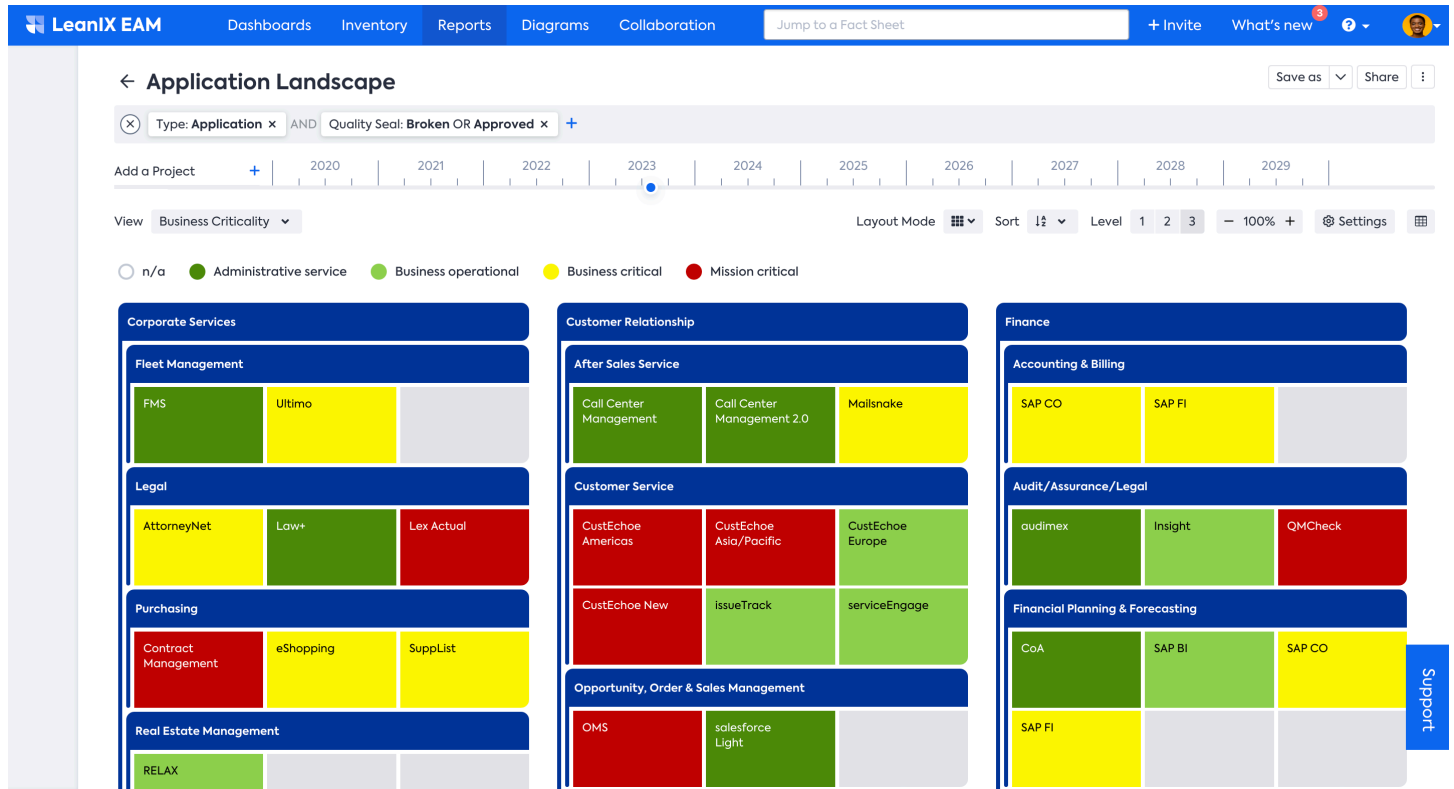

Inventory and Collaboration

The inventory is the centralized repository where you create, add, and manage fact sheets. If you are seeking information from the fact sheets or if you are responsible for maintaining and ensuring the accuracy of the information in a fact sheet, the inventory is your go-to place.

Documenting an organization's IT landscape is a collaborative effort, and contributors such as application owners, business owners, data architects, etc., play an important role. Collaboration features like [surveys](#), [fact sheet subscription](#), [comments](#), and [to-dos](#) help keep data accurate and up-to-date. Additionally, [fact sheet completeness](#) and [quality seal](#) features assist enterprise architects in tracking the quality and completeness of data.

Reports and Diagrams

[Reports](#) and [diagrams](#) in SAP LeanIX provide visual representations and insights into your enterprise architecture data. You use reports to obtain a clear overview of the as-is and future-state architecture and identify trends, redundancies, and risks. For instance, landscape reports can be used to get a comprehensive view of the IT landscape, matrix reports provide correlations between attributes of different fact sheet types, and roadmap reports can be used to outline strategic initiatives and priorities for future-state architecture.

Application Landscape Report

Similarly, diagrams enable you to build visual models of an organization's enterprise architecture. You can break down complex architecture into manageable parts and interactively visualize relationships, data flow, and dependencies between various architectural elements. These visualization and analytical capabilities enable enterprise architects to chart out needed action plans, such as application rationalization, modernization, cloud migration, ERP transformation, etc.

Who Uses SAP LeanIX

A variety of individuals in different roles use SAP LeanIX:

- **Enterprise architects:** document, model, analyze, and optimize the enterprise architecture of the entire organization. To get started as a workspace administrator, see [SAP LeanIX for Enterprise Architects](#).
- **CIOs and IT leadership:** gain a holistic view of IT performance, identify areas for optimization, and ensure alignment of IT with overall business strategy.
- **Application and business owners:** understand how IT supports their business capabilities, ensure application data is accurate and up to date, and make data-driven decisions for improvement. To understand how to use SAP LeanIX, see [SAP LeanIX for Application and Business Owners](#).
- **IT security:** manage compliance, data privacy, and risk across the organization's tech landscape. To learn how obsolescence risk is managed, see [Obsolescence Risk Management](#) use case.
- **Transformation and project managers:** gain transparency into all IT projects to create roadmaps, manage interdependencies, refine budgeting, and mitigate risk. To understand how to use SAP LeanIX, see [SAP LeanIX for Application and Business Owners](#). For a better understanding related to your roles, explore the [SAP LeanIX Architecture and Road Map Planning](#) guide and [SAP ERP Transformation with Integrated Toolchain](#) use case.
- **Solution architects:** design, implement, and integrate solutions to meet specific business and technology needs.

Resources

For additional resources for further insights and support, see [SAP LeanIX Resources](#).

SAP LeanIX for Enterprise Architects

First steps in using SAP LeanIX as an enterprise architect.

Access Your Workspace

An onboarding manager from SAP LeanIX provisions a workspace according to your contract and sends access links via email. Follow the link to set up your credentials and gain access to your workspace. The first user who registers for a workspace becomes the primary administrator.

- If you're the primary workspace administrator, set up your workspace, invite users, and manage access permissions. For details, see [Set Up User Access](#).
- If you are not an administrator, your workspace administrator invites you to your organization's workspace. Follow the link in the invitation email to set your credentials, then sign in to the workspace.

Understand the Meta Model

The SAP LeanIX meta model is a conceptual framework that defines the structure and relationships of architectural elements within an organization's enterprise architecture landscape. It consists of various fact sheet types (such as application, IT component, business capability, and more) and the relations between them. This model serves as a comprehensive blueprint for organizing and interconnecting information about your enterprise architecture.

To get started, explore the key fact sheet types included in the meta model and see modeling best practices. For detailed information, see [Meta Model](#).

Explore Use Cases

SAP LeanIX offers various use cases to help enterprise architects shape the digital landscape of their organization. Explore use cases and develop your strategy. Start with application portfolio assessment, then proceed to more advanced use cases.

SAP LeanIX Application Portfolio Management	SAP LeanIX Technology Risk and Compliance	SAP LeanIX Architecture and Road Map Planning
Application Portfolio Assessment	Obsolescence Risk Management	Application Modernization
Application Rationalization		SAP ERP Transformation with Integrated Toolchain
AI Governance and Adoption		

Import Data into Your Workspace

Your next step would be getting data into SAP LeanIX inventory. It is important to define a realistic and practical scope before starting out. Rather than aiming to gather everything at once, consider an iterative approach that aligns with your organization's situation and data management practices. Start by planning and mapping your existing data model to the SAP LeanIX data model. Deliberate on import strategies and decide when it is advantageous to use the 'Excel Import/Export' option versus other options such as SaaS Discovery. Consider how configuring your meta model fits into your workflow.

To get an overview of getting data into SAP LeanIX and to understand the steps, refer to [Getting Data into Your Workspace](#).

Collect Data from Fact Sheet Owners

Effective data collection is crucial for informed decision-making. However, the challenge lies in managing the vast amount of data and ensuring its accuracy and relevance over time. Assigning responsibility and accountability to the contributors is the key.

Once you have the initial data in your workspace, the next step is to set the responsibilities to users regarding a Fact Sheet by assigning Subscription Roles. It is a mechanism to ensure subscribers of Fact Sheets are notified and have a clear call-to-action to maintain and administer the Fact Sheet data.

When defining a Subscription Role, you specify the Subscription Type for that role. Subscription Type determines the responsibilities of a Subscription Role with respect to Fact Sheets. Subscription Type can be one of the following types:

- **Responsible:** This Subscription type is in charge of keeping the Fact Sheet up to date and correct.
- **Accountable:** Subscription roles of this type carry overall accountability and often handle business responsibilities associated with Fact Sheets.
- **Observer:** Subscription roles of this type are notified and kept up-to-date .
- **All:** When defining a Subscription role, you can choose all the above types for increased flexibility.

Once defined, you can assign users, or users themselves can subscribe to Fact Sheets based on the defined Subscription roles and types.

To learn more, see [Subscription Roles](#).

Set Up User Access

Invite users to your workspace and manage their access permissions.

Explore Authentication and Authorization Options

SAP LeanIX offers several options for managing authentication and authorization.

- **Authentication** is the process of verifying the identity of a user or system attempting to access SAP LeanIX. You can manage authentication in SAP LeanIX or through single sign-on (SSO).
- **Authorization** determines what actions an authenticated user is allowed to perform in SAP LeanIX. You manage authorization by assigning user roles and defining permissions, either in SAP LeanIX or through SSO.

Choose how you want to manage authentication and authorization for your organization. For detailed information, see [Authentication and Authorization](#).

Access Your Workspace

The first user who registers for a workspace becomes the default administrator. Workspace administrators have extensive rights and can make significant changes to the workspace. We recommend assigning this role to enterprise architects or users with strong IT skills and expertise.

An onboarding manager from SAP LeanIX provisions a workspace according to your contract and sends an access link via email. Follow the link to set up your credentials for the workspace. Once you get access, you can invite other users to your workspace.

If you are not the primary workspace administrator, your administrator invites you to your organization's workspace. Follow the link in the invitation email to set your credentials, then sign in to the workspace.

Invite the Core Team

The core team is a group of key stakeholders in your organization working with SAP LeanIX. Identify the key stakeholders who will have administrator access to your workspace, then invite them.

Setting up single sign-on (SSO) is recommended for streamlined user and access management. Before configuring SSO, manually invite the core team and start setting up your workspace with them.

To invite users to your workspace manually, follow these steps:

1. On the user profile menu, select [Invite User](#).
2. In the overlay that appears, enter users' email addresses and select a role.
3. Choose [Invite](#).

X

Invite to Workspace

E-Mail Addresses *

Message

I would like to invite you to SAP LeanIX, a tool for managing our IT landscape in a simple yet effective way. Please use the link below to join our workspace.

A header and the link is automatically added to the e-mail.

How to Invite?

Please provide the e-mail addresses of the users you would like to invite to this workspace. Hit enter after typing each e-mail address.

The user will receive an e-mail from SAP LeanIX (support@leanix.net) in order to complete their account details (full name and password).

Cancel
Invite

Inviting Users from a Workspace

After confirming the invitation and setting credentials, users get access to the workspace.

Set Up Single Sign-On (SSO)

To streamline user and access management for your organization, set up SSO. With SSO, users sign in to SAP LeanIX through your organization's identity provider (IdP) system, which ensures secure access. Work with your IT administrators to define the SSO setup that suits your organization.

You can manage authorization (user roles) in SAP LeanIX or through your IdP. When setting up SSO, choose how you want to manage authorization.

Optionally, you can set up System for Cross-Domain Identity Management (SCIM) to automatically sync user states from your IdP, which streamlines user provisioning, deprovisioning, and updating.

For detailed information, refer to:

- [Single Sign-On \(SSO\)](#)

- [SCIM Provisioning](#)

Manage Roles and Permissions

In SAP LeanIX, permissions are role-based. Users with specific roles receive all permissions associated with those roles. Here are the standard user roles:

- **Viewer:** Has view permissions for fact sheets, can subscribe to them, and comment.
- **Member:** Has edit permissions for fact sheets and can create new ones.
- **Admin:** Has all permissions of a member and administrator permissions for a workspace.

As an admin, you configure permissions for non-admin roles, including permissions for fact sheets and other entities. For more information, see [User Roles and Permissions](#).

If you use SSO for both authentication and authorization, you can create custom user roles to define more granular permission levels for each role. For more details, see [Custom User Roles](#).

To learn more about managing users and configuring advanced access settings, see [User and Access Management](#).

Getting Data into Your Workspace

Learn what your options are for getting data into SAP LeanIX, what data to start with, and what you can do next.

Overview

This guide helps you understand the different ways you can bring data into your SAP LeanIX workspace and what you should focus on first when getting started.

It orients you on which key fact sheets to prioritize in the initial stage and highlights the essential considerations to keep in mind so the data you add is useful from the start.

You will also know what typically comes next, such as assessing your application portfolio, improving data quality, and gradually expanding your inventory to support rationalization and modernization efforts.

Ways to Get Data into Your Workspace

There are several ways in which you can get data into SAP LeanIX; here is an overview:

- **Out-of-the-box integrations and discovery:** Built-in integrations and discovery features to automatically import data and create fact sheets. To learn more, see [Discovery and Integrations](#).
- **Inventory builder:** Uses AI to extract architecture elements from diagrams and images and converts them into fact sheets and relations. To learn more, see [Inventory Builder](#).
- **Excel import/export:** Import pre-collected architecture data in bulk through an Excel file. For a detailed guide, see [Importing Fact Sheet Data Through Excel File](#).
- **Manual fact sheet creation:** Create and update fact sheets individually directly in the inventory. For a detailed guide, see [Adding and Editing Data in Fact Sheets](#).

Focus on Foundational Fact Sheets First

For a meaningful starting point, start with **application**, **business capability**, and **organization** fact sheets. These three form the foundation of your enterprise architecture landscape. Together, they allow you to see how IT supports the business and who is responsible for it, and help you keep the scope of your initial assessment manageable.

Start by importing application data, then define your business capabilities and organizational structure. Finally, link applications to the relevant capabilities and organizations so you can begin meaningful analysis.

Key Considerations When Building Your Inventory

- When adding fact sheets, focus on accuracy and relevance rather than volume. Focus on key applications, core business capabilities, or key business units to begin with. Well-structured and well-related fact sheet data is far more valuable for analysis and decision-making than a large but poorly maintained inventory.
- Ensure clear naming and meaningful descriptions for fact sheets so others can understand without additional context.
- Involve the appropriate stakeholders, business, IT, HR, or application owners to validate key information, relationships, usage, and dependencies.
- Aim for completeness of essential attributes from the start. For example, see [Key Attributes for Application Portfolio Assessment](#).
- Keep fact sheet hierarchies simple: limit depth to two or three levels and avoid excessive granularity.
- Model fact sheets to represent how your organization actually operates and how your organization delivers value, rather than mirroring formal organizational structures.

Next Steps

Assess Your Application Portfolio

Link applications to the relevant business capabilities and organizations to get started with analysis. Start with the application portfolio assessment use case to get a 360° overview of your enterprise architecture landscape, evaluating its interdependencies, usage, and contribution to the business. For a detailed guide, see [Application Portfolio Assessment](#)

Ensure High Data Quality

The accuracy of your analysis depends on the completeness and quality of your data. Improve data quality by using features such as fact sheet completion scores, subscriptions, mandatory fields, quality seals, and surveys. Use integrations and data from the reference catalog to automatically enrich your inventory with accurate, up-to-date information. For more details, see [Increasing Your Data Quality](#).

Expand Your Inventory

As your enterprise architecture practice matures, you can use additional integrations to bring in more fact sheet types, extending the scope and depth of your enterprise architecture inventory.

Fact Sheet	Best Practices	Detailed Guides
IT components	You can use the ServiceNow integration to build your technology inventory swiftly by discovering IT components and applications. If your organization uses SAP systems and services, the SAP discovery feature	• ServiceNow Integration • SAP Discovery • IT Components in the Reference Catalog

Fact Sheet	Best Practices	Detailed Guides
	discovers IT components following SAP LeanIX modeling best practices. Linking IT components to the reference catalog enriches and standardizes fact sheet data using curated information from the catalog.	
Business context / Process	The SAP Signavio integration enables the import of business processes managed in SAP Signavio into SAP LeanIX as business context fact sheets.	SAP Signavio Integration
Data object	The Collibra integration allows you to seamlessly import data assets from the Collibra data catalog into SAP LeanIX as data object fact sheets.	Collibra Integration

Assess Applications for Rationalization and Modernization

You can then assess applications based on important criteria such as business criticality, functional fit, and technical fit, and apply the TIME assessment and 6R frameworks. Such evaluations help you in your rationalization and modernization initiatives. For detailed guides, see [Application Rationalization](#) and [Application Modernization](#).

Use Cases

Overview of SAP LeanIX use cases.

As an enterprise architect, you steer the initiatives that shape the digital landscape of your organization. One of your initial tasks using SAP LeanIX is conducting an application portfolio assessment. This involves systematically reviewing and documenting your organization's applications, and assessing their interdependencies, usage, and business contribution. Beyond this foundational task, SAP LeanIX helps you with a range of use cases:

SAP LeanIX Application Portfolio Management	SAP LeanIX Technology Risk and Compliance	SAP LeanIX Architecture and Road Map Planning
Application Portfolio Assessment	Obsolescence Risk Management	Application Modernization
Application Rationalization		SAP ERP Transformation with Integrated Toolchain
AI Governance and Adoption		

Ensure a smooth start to your SAP LeanIX initiatives by familiarizing yourself with the [Meta Model](#) and modeling guidelines before starting with your first use case. SAP LeanIX meta model, represented by fact sheet types and their relations, is at the heart of SAP LeanIX. It defines relationships between different fact sheet types, illustrating how information in fact sheets is interconnected. This blueprint assists you in understanding connections between various architectural objects. It allows for customization to meet unique organizational requirements and define your architectural structure and relationships.

SAP LeanIX for Application and Business Owners

First steps in using SAP LeanIX for application and business owners.

Enterprise Architecture Management is a collaborative effort. Various stakeholders, such as Application Owners, Business Owners, Data Architects, Product and Project Managers, etc, all play an important role in contributing relevant information to EAs. They ensure Fact Sheets contain accurate and up-to-date information by updating relevant attributes, dependencies, and relationships.

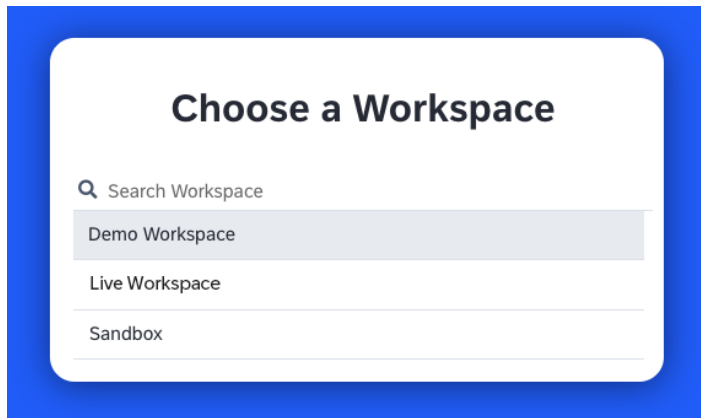

Notably, the roles of Application Owners and Business Owners are particularly significant. As a contributor, it is important to learn how to access the Fact Sheets you are responsible for, fill and access information in them, and become familiar with collaboration features. These essentials will help you get started effectively.

To start, familiarize yourself with SAP LeanIX application layout and navigation. Go through Introduction to SAP LeanIX if you haven't already.

Access the Workspace

Admins of the workplace provide access to users. Depending on the setup, you can either access with your organizations single-sign on credentials or by following the instructions you'll receive with an invitation email.

In case you have been invited to more than one workspace, you can select the workspace you want to access.

One of the first steps after gaining access is to complete your profile. It includes resetting the password, updating personal information and configuring notification settings if need be. For more detailed instructions, see [User Profile](#).

Find Information from Fact Sheets

[Fact Sheets](#) are used to document and save information regarding architectural objects, like Applications, Business Capabilities, Projects, IT Components, etc. SAP LeanIX can serve as your single source of truth for any information related to your organization's IT landscape. Let's look at a couple of common scenarios to get a better understanding of how it can be useful for you.

For instance, you may want to check which applications support specific business capabilities in a particular region or business unit. To find that information from fact sheets, do the following:

1. Navigate to the [Inventory](#) tab in your workspace.
2. Make use of the [Search and Filter functions](#) in the Inventory.
 - a. Select [Application](#) from the Filter panel on the left to apply a filter that displays only the Application Fact Sheets.
 - b. Select the Business capabilities, regions, and business units to narrow down to your requirements.

You now have a list of all applications that support a particular business capability in a particular business unit.

The screenshot shows the LeanIX EAM 'Inventory' page. The left sidebar contains filters for 'TYPE' (Objective, Platform, Initiative, Business Capability, Business Context, Organization, Application, Interface, Data Object, IT Component, Provider, Tech Category) and 'HIERARCHY LEVEL' (Level 1, Level 2, Level 3). The main content area displays a list of applications with details such as 'AC Management', 'AC Management Cloud', 'AC Management to HR Admin', 'accenture', 'accenture App Maintenance & Support Service (Accenture)', 'Account', and 'acctur'. Each application entry includes a description, completion status, and date. The top navigation bar includes 'Dashboards', 'Inventory', 'Reports', 'Diagrams', 'Collaboration', and a search bar. The right sidebar has a 'Support' button.

Finding Fact Sheets

Maybe you are seeking details about a particular application and want to contact the responsible person to get access or a license. To find information in the Fact sheet, do the following:

1. Access a specific Fact Sheet by searching for it in the search bar at the top. You can also scroll through the list of Application Fact Sheets in the Inventory.
2. Click on the Fact Sheet to open it for detailed viewing.
3. Browse through different tabs of the Fact Sheet to view relevant details about the application.

To learn more about Fact Sheets, see [Fact Sheets](#).

Another scenario could be that you might be overseeing a portfolio of Applications or Business, with responsibilities extending to multiple Fact Sheets. You can access all your subscribed Fact Sheets in one place by filtering for subscribed Fact Sheets:

Contribute Data to Fact Sheets

To input or update information on a Fact Sheet, go to the Inventory and open the relevant Fact Sheet. At the top of a Fact Sheet, you will find a header displaying key details such as name, type, tags, and description. Below this header, there are several tabs: Fact Sheet, Subscriptions, Comments, To-Dos, Resources, etc., to document and manage diverse information.

The attributes and information you find in Fact Sheets depend on the type of Fact Sheet. To edit or add any information, do the following:

1. Hover over the section you wish to edit.
2. On the right side corner of the section, you will find buttons for [Edit](#) or [Add](#).
3. Click on the relevant button and provide your input.
4. Click [Save](#) at the end.

To learn more on how to add or edit data in a fact sheet, see [Adding and Editing Data in Fact Sheets](#).

Adding data to Fact Sheet

Depending on your role, certain Fact Sheets are more relevant to you than others. For instance, Application Owners focus on Application Fact Sheets, Business Owners typically handle Business Capability Fact Sheets, and Transformation and Project Managers concentrate on Initiative and Project Fact Sheets. Similarly, Data Architects contribute to Data Object Fact Sheets, and so forth.

Example: Filling an Application Fact Sheet

In the Application Fact sheet, essential attributes include Name, Lifecycle information, Functional fit, Technical fit, the Business Capabilities it is supporting, Business Criticality, the IT components it is relying on, etc.

The video below provides a quick overview of how to complete the Application Fact Sheet and offers best practices to help you understand the attributes and make informed choices:

Next Steps

SAP LeanIX has collaborative features to make user participation easier in enriching and validating data. As a next step, familiarize yourself with the following features that support collaboration with your organization's enterprise architects.

- **Comments:** The Comments tab is available on all Fact Sheets. When a comment is posted on a Fact Sheet, the responsible persons for that Fact Sheet are promptly notified. This allows you to propose updates or seek clarification without directly altering the content of the Fact Sheet. This feature is beneficial, as it allows one to request support directly from the responsible person, avoiding the inconvenience of email and preventing them from being overwhelmed with excessive communication.
- **Survey:** A Survey is a collaborative way to gather information from several stakeholders in one go. When the administrator, in this case, the Enterprise Architect, sends out surveys, the responsible contributors receive notifications in the Survey tab of the Fact Sheets as well as via email. The provided response could directly update relevant fields in the Fact Sheets. To learn more about Surveys, see [Surveys](#).
- **Quality Seal:** The Quality seal is a mark of accurate and up-to-date data on a Fact Sheet. A responsible or accountable subscriber of the Fact Sheet approves the Quality Seal after verifying correctness and completeness. If any user who is not responsible or accountable makes a change to the Fact Sheet, the Quality Seal is broken. The responsible or accountable subscriber can easily notice this change through the Quality Seal indicator button located at the top right of every Fact Sheet. To learn more about Quality Seal, see [Quality Seal](#).

Collaboration features in Fact Sheet

Navigating SAP LeanIX

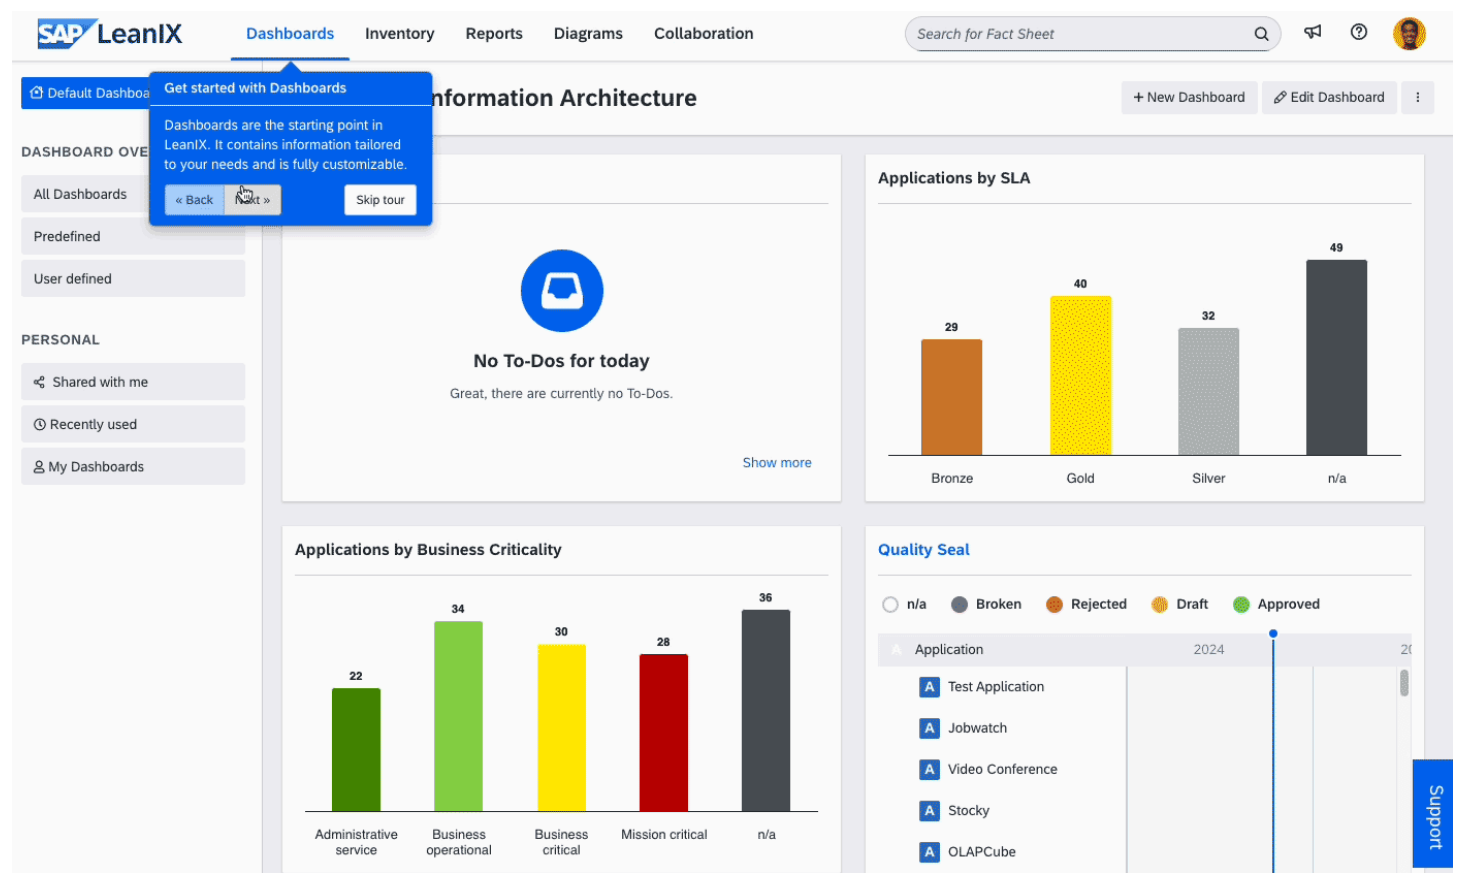

Overview of the SAP LeanIX user interface.

The SAP LeanIX application offers a user-friendly interface that allows seamless navigation across its multiple features. The application's main navigation bar located at the top of the screen provides quick access to key items such as dashboards,

inventory, reports, diagrams, and collaboration features. Furthermore, from the navigation bar, you can search for fact sheets, view product updates, access various support and enablement resources, and navigate to your personal and workspace settings.

→ Tip

To get an overview of the user interface (UI) and the key features in SAP LeanIX, in the **Help** menu indicated by a question mark icon, select **Start Help Tour**.

Navigating SAP LeanIX

In the following table, you can find an overview of the main UI elements within the SAP LeanIX application.

UI Element	Overview	Additional Information and Resources
Dashboards tab	Your entry point to the SAP LeanIX workspace is the dashboard. The dashboard offers a centralized overview of important metrics, performance indicators, and relevant information within a workspace. It comes with several predefined dashboard panels that provide real-time views of data and user reports, charts, and widgets. The dashboard presents information in a visually appealing way. The primary purpose of a dashboard is to help stakeholders monitor the performance of the architecture, communicate effectively with each other, and make better, data-driven decisions.	Dashboards
Inventory tab	The inventory is a centralized repository that stores and organizes information about	Inventory

UI Element	Overview	Additional Information and Resources
	all architectural elements in the form of fact sheets. Each architectural object, such as application, business capability, organization, and more, is represented by fact sheets that store relevant information. The inventory is the place where you can create and edit fact sheets. You can search and filter fact sheets based on your requirements using the left-side pane. You can navigate to a fact sheet by selecting it.	
Reports tab	Reports allow you to generate default and custom visual reports based on your enterprise architecture data. These reports provide insights, analysis, and visualization of the architecture, enabling data-driven decision-making and effective communication.	Reports
Diagrams tab	Diagrams are advanced features typically used by enterprise architects to create visualizations of data flows and to visualize complex architecture by breaking it down into smaller scopes. Like reports, diagrams are also a great tool for effectively presenting data to various stakeholders.	Diagrams
More menu	From the More menu, you can access the following: • To-dos • Surveys • Presentations • Architecture decisions • Software bill of materials (SBOM) explorer • Reference catalog • Portals • Extension hub	• To-Dos • Surveys • Presentations • Architecture Decisions • SBOM Explorer • Reference Catalog • Portals • Downloading Reports from the Extension Hub • Publishing Custom Reports to the SAP LeanIX Extension Hub
Search field	This field provides a full-text search feature that allows you to quickly find a fact sheet within the inventory or directly navigate to a specific fact sheet without opening the inventory.	Searching and Filtering in the Inventory
Workspace views list	Use workspace views configured by admins to limit the scope of displayed information and focus on your current tasks.	Workspace Views

SAP LeanIX Resources

In addition to product documentation, there are several other resources to help you to get the most out of SAP LeanIX.

The following table lists the resources offered by SAP LeanIX. It provides an overview of how to use these resources and the type of information you can expect to find.

Resource	Content Offered
Documentation	Documentation offers guidance on using SAP LeanIX products.
SAP for Me 	Customer portal for SAP customers, which is the central entry point for SAP support, alerts, metrics, and insights into your SAP product portfolio.
SAP Learning 	SAP Learning is a comprehensive digital platform that enables users to develop skills and earn certifications across SAP solutions. It offers a broad selection of courses, including those for SAP LeanIX, to help you build your expertise.
Onboarding Resource Center 	A collection of resources that you need to seamlessly onboard your team and kickstart projects on the path to go-live.
Product Roadmap 	The SAP LeanIX Product Roadmap provides a structured visualization of the planned and released features. Here, you can vote for features that you'd like to be implemented in the application and submit your ideas for new features.
Website download area 	Wide range of learning materials in the formats of White Papers, Tools, Success Stories, Posters, Presentations, Videos, and Documents. Various topics related to enterprise architecture, such as agile management, application rationalization, IoT architecture, and technology risk, are covered through the documentation.
Product Updates 	Latest updates and announcements for SAP LeanIX products.
Blog 	Fresh insights into the most up-to-date news on SAP LeanIX and the industry.
SAP LeanIX extension hub 	The extension hub is a centralized location where you can discover and install ready-to-use extensions for your SAP LeanIX workspace. These include meta model extensions, surveys, and custom reports.
SAP LeanIX Community 	It is a platform for the customers to build a community around the best practices and SAP LeanIX Product Usage.
YouTube channel 	SAP LeanIX's YouTube channel offers recorded webinars and tutorials.

Find answers to frequently asked questions about SAP LeanIX.

Think of fact sheet as a structured information page that captures key details about a specific element of your IT landscape, such as an application, IT component, project, or business capability. It allows you to store details like owner, lifecycle, and description, and connect it to other related fact sheets. By linking these together, you get a clear and comprehensive view of how everything in your organization fits and works together. To learn more, see [Fact Sheets](#).

A SAP LeanIX workspace is the logical group of fact sheets, users, and viewers. Usually, a company uses exactly one workspace for its enterprise architecture management activities. But there are use cases, in which more than one workspace is used. For example, for different organizational units or subsidiaries, it can make sense to have multiple parallel workspaces.

We are continuously working on providing the best experience to our users. Using the newest technology available on the market sometimes requires drop support for some older browser versions. The following browsers are currently fully supported:

- This is custom documentation. For more information, please visit [SAP Help Portal](#).

- Last two versions of [Google Chrome](#)
- Last two versions of [Safari/iOS](#)
- Last two versions of [Microsoft Edge](#)
- [Opera](#) version 100 and above

How Can I See the Current Version?

To view the current version, click the help icon (?) icon in the top navigation bar, then select [About SAP LeanIX](#).

The screenshot shows the SAP LeanIX dashboard. A modal dialog titled "LeanIX (Build: 8994e824e9c)" is open, displaying the following information:

About	
Region	EU
API	Browse API
Status	status.leanix.net
Detailed statistics	monitoring.leanix.net

At the bottom of the dialog are buttons for "Copy", "Download", and "Close".

In the background, the help menu is open, showing options like "Start Help Tour", "Provide Feedback", "SAP LeanIX Learning", "SAP LeanIX Community", "Getting Started Guide", "Documentation", "Developer Tools", "About SAP LeanIX" (highlighted), and "Legal Information".

What Personal Data Is Stored in SAP LeanIX?

We have to balance our service between the minimum number of personal data and maximum support. Therefore, we only store your first name, last name, email address, encrypted password, the time of your last online request in SAP LeanIX, your registration status, the used browser, whom you invited to a workspace, and all changes you made in SAP LeanIX.

How Can I Retrieve the Changelog for Any Changes Made to a User Within SAP LeanIX?

To request logs regarding any changes made to a user or role, please contact [SAP For Me](#) ➡ .

Where Can I View and Access My Personal Data?

For more information, see [Users Overview](#).

How Can I Export My Data from SAP LeanIX?

For more information, see [Exporting Fact Sheet Data as Excel File](#).

Implemented Security Measures in SAP LeanIX

Here is a list of the major measures we have implemented: 256-bit SSL encryption, extended validation from well-known Verisign, an ISO27001 certified service provider, daily database back-up, database encryption of certain fields like e-mail address, and extended password hashing.

SAP LeanIX was furthermore certified by German TÜV in 2015, indicating that data privacy and IT security measures are states of the art, particularly according to ISO/IEC 27000. For any security-related concerns, reach out to the SAP Customer Interaction Center at [Contact CIC](#). If you're an SAP customer, you can reach out to your Customer Success Manager (CSM) or submit a request from the [SAP for Me](#) portal

Contact Support

If you encounter issues, have questions, or need assistance with SAP LeanIX, our support team is here to help. You can contact support directly within SAP LeanIX or submit a request in the SAP for Me portal.

Submitting a Request in SAP LeanIX

Context

Learn how to access support directly from the main navigation in SAP LeanIX. For more information about using built-in support, refer to [Built-In Support](#).

Procedure

1. To open the built-in support panel, choose the headset icon in the main navigation.

The panel opens with a search bar and a list of recommended links. If your SAP Universal ID is linked to an S-user account, the built-in support panel shows a summary of your support cases.

2. Choose [Report New Issue](#) to create a new support request.

Submitting a Request in the SAP for Me Portal

Context

Learn how to submit a support request in SAP for Me. For a video tutorial, visit: [Creating a Support Case in SAP for Me](#).

Procedure

1. Go to the [SAP for Me Portal](#) and log in with your credentials.
2. Go to [Services & Support](#) > [Get Support](#).
3. Choose [Report New Issue](#).
4. Select a relevant customer.
5. Fill in the basic information requested.

Be sure to select [SAP LeanIX \(LIX-EAM\)](#) as the affected system.

6. Choose [Continue](#).

SAP Support AI suggests a channel based on the basic information you provide.

7. To create a case without using the recommended channel or one of the other alternatives, choose [Create a Case](#).

8. Provide detailed information about the question or problem, including:

- a. Steps to reproduce the problem.
- b. Timing of the issue occurrence.
- c. Screenshots or other relevant attachments.
- d. If related to workspace provisioning, provide the SAP Order ID.

You can find this in the [Materials](#) field of the [Provisioning Status](#) card for the relevant product.

- e. If applicable, assign additional contacts to the case.
- f. Choose [Submit Case](#).

Additional Resources

- [SAP Product Support](#) : Access support for all SAP products, including guides, troubleshooting, and community forums.
- [SAP for Me: Customer Portal](#) : The centralized platform for managing your SAP products, licenses, and support cases.
- [SAP Customer Interaction Center \(CIC\)](#) : Contact SAP support directly through the Customer Interaction Center for personalized assistance.
- [Creating and Managing S-Users in SAP For Me](#): Detailed information about S-user accounts, including setup, management, and troubleshooting.

Onboarding Journey

Understand the objectives and key steps of your onboarding journey. Explore the available support channels and learning resources.

Overview

Onboarding with SAP LeanIX is designed to help you build foundational knowledge and realize first business value through practical, hands-on experience. You'll engage in real-world tasks using actual data and collaborate with colleagues to enhance your learning experience.

The onboarding process typically takes about six to eight weeks. Ensure to plan your onboarding and involve your team early for efficient collaboration.

What You'll Achieve

- **Build foundational knowledge:** Learn the essential concepts of SAP LeanIX to support your future architecture work.
- **Gain practical experience:** Use the core features and capabilities of SAP LeanIX to get hands-on practice.
- **Accelerate time to value:** Complete your first application portfolio assessment to establish transparency and governance over your as-is landscape. By importing initial data into your workspace and setting up data governance processes, you achieve first tangible results that you can share with stakeholders to demonstrate the value of SAP LeanIX.

How to Get Started

Set Up Your Workspace

1. Provision the workspace and invite users. For details, see:

- [Workspace Provisioning from SAP for Me](#)
- [Set Up User Access](#)

2. Set up branding settings for your workspace. To learn more, see [Branding Settings](#).

3. Configure general settings for your workspace: currency, default language, fiscal year, and more. For details, see [General Settings](#).

For additional information about managing your workspace, see [Workspace Administration](#).

Map Your Application Inventory (Application Portfolio Assessment)

Establish a single source of truth for your enterprise architecture and answer critical questions like: What applications are in use? Where are there redundancies?

This initial application portfolio assessment involves three key steps:

1. Add your data.
2. Collect and maintain data by assigning governance.
3. Assess your application portfolio.

For detailed information on each step, see [Application Portfolio Assessment](#).

Who to Involve

Involve relevant teams in the onboarding process to ensure efficient collaboration:

- **Core team:** Engage your core team early and bring in additional stakeholders as you progress. Include colleagues who primarily work with SAP LeanIX from the start.
- **Senior sponsor (management/C-level):** Secure support from a senior sponsor, such as a VP or C-level executive, with the authority to drive adoption. Their responsibilities include:
 - Sponsoring the rollout of SAP LeanIX in the organization, including calls to action and reminders for data input.
 - Helping identify and convince relevant users and groups to participate.
 - Defining clear objectives and business purposes for SAP LeanIX.
- **Data contributors (fact sheet owners):** Identify a pilot group of data contributors. Select a small, strategic group of application and business owners for your initial data collection. Testing your assignments and dashboards with a pilot group builds early champions, increases user acceptance, and ensures smooth alignment before the enterprise-wide rollout of SAP LeanIX. For details, see [Identify and Assign Fact Sheet Owners](#).

Align with your senior sponsor in a meeting or kick-off to plan the long-term vision for SAP LeanIX. Focus on the following:

- Secure their support across the organization, including active engagement of users in collecting and maintaining data.
- Get an overview of current priorities and potential needs from the enterprise architecture team.

Resources and Support

Learn the Platform

- [Documentation](#): Explore use cases, tutorials, and detailed feature guidance. Documentation plays a key role during onboarding as it offers links to in-depth topics and step-by-step instructions..
- [Onboarding resource center](#) 📁: Find essential resources needed to prepare, start, and succeed throughout your onboarding journey.
- **Your SAP LeanIX track**: Build expertise as you progress. We recommend that you complete these brief courses in sequence during your first six weeks:
 1. [Getting Started with your SAP LeanIX Onboarding](#) 📁
 2. [Adding First Data to Your SAP LeanIX Workspace](#) 📁
 3. [Getting Your Stakeholders on Board, Enriching Data and Taking First Decisions](#) 📁

Get Support

- [Support](#): If you encounter issues or need assistance, contact support through the [SAP for Me Portal](#) 📁.
- [Q&A sessions](#) 📁: Join live onboarding calls with our customer success managers to discuss specific questions and learn from others.
- [Community](#) 📁: Engage with the SAP LeanIX community to share best practices, connect with peers, and interact with our team. The community serves as a central knowledge platform, offering access to documentation and other resources.

For a list of additional resources, see [SAP LeanIX Resources](#).
